The material in this document has been subject to Agency technical and policy review and approved for publication as an EPA report. Mention of trade names, products, or services does not convey, and should not be interpreted as conveying, official EPA approval, endorsement, or recommendations.

This report is copied on recycled paper.

CONTRIBUTING ORGANIZATIONS

The study described in this report was funded by the U.S. Environmental Protection Agency and the U.S. Department of Housing and Urban Development. The study was managed by the U.S. Environmental Protection Agency. The study was conducted collaboratively by two organizations under contract to the Environmental Protection Agency, Midwest Research Institute and QuanTech. Each organization's responsibilities are listed below.

Midwest Research Institute

Midwest Research Institute (MRI) was responsible for initiating the pilot study on schedule, for overall production of the Quality Assurance Project Plan for both the pilot and the full study, for providing input to the design of the study, for planning and supervising the field work, for collecting paint samples, for the laboratory analysis of paint chip samples, and for writing sections of the technical report.

QuanTech

QuanTech (formerly David C. Cox & Associates) was responsible for the design of the study and contributions to the Quality Assurance Project Plan for the pilot and full studies, for participation in field work, for data management and statistical analysis, and for overall production of the technical and summary reports.

U.S. Environmental Protection Agency

The U.S. Environmental Protection Agency (EPA) co-funded the study and was responsible for managing the study, for reviewing study documents, and for arranging for the peer review of the final report. The EPA Project Leader was John Schwemberger. The EPA Work Assignment Managers were John Scalera and John Schwemberger. The EPA Project Officers were Jill Hacker, Samuel Brown, and Janet Remmers. Cindy Stroup was the Branch Chief of the Technical Programs Branch and initiated this study.

U.S. Department of Housing and Development

The Department of Housing and Urban Development (HUD) co-funded the study and identified sources of housing for the study. Bill Wisner was the key HUD staff member.

ACKNOWLEDGMENTS

The study could not have been done without the assistance and cooperation of the Housing Authority of Louisville, the Denver Housing Authority, and the Philadelphia Housing Authority.

Special thanks are due to Mike Godfrey and George Adams of the Housing Authority of Louisville, Mark Ward and Ben Roybal of the Denver Housing Authority, and John Peduto, Cynthia Jones, and Bill Zollicoffer of the Philadelphia Housing Authority.

EXECUTIVE SUMMARY

BACKGROUND

This study was undertaken by the U.S. Environmental Protection Agency (EPA) and the U.S. Department of Housing and Urban Development (HUD) to collect information needed for the development of federal guidance on testing paint for lead. Prior to this study, lead testing information was inadequate as little formal evaluation had been done of the various field testing methodologies.

The impetus for this study came from the passage of Title X (Section 1017 of the Residential Lead-Based Paint Hazard Reduction Act of 1992), which mandated that the federal government establish guidelines for lead-based paint hazard evaluation and reduction. This study was designed to produce the type of detailed information EPA and HUD needed in order to respond to that mandate, and focused on two field technologies that are used for testing for lead in paint: portable X-ray fluorescence (XRF) instruments and chemical test kits. A pilot study was conducted during March and April 1993 in Louisville, Kentucky. The full study was conducted from July through October 1993 in Denver, Colorado and Philadelphia, Pennsylvania.

This is the data documentation report of the study. This report contains information about the data files and data records developed from the study data. Two other reports are available on the study. The report *A Field Test of Lead-Based Paint Testing Technologies: Summary Report* (EPA 747-R-95-002a) contains a summary of study procedures and results. This report can be requested by calling the National Lead Information Center at 1-800-424-LEAD. The report *A Field Test of Lead-Based Paint Testing Technologies: Technical Report* (EPA 747-R-95-002b) contains technical detail on study procedures and results. The technical report can be ordered from the National Technical Information Service (NTIS) at 703-487-4650 (NTIS reference number: PB96-125026).

TECHNOLOGIES EVALUATED

This study evaluated XRF instruments and chemical test kits. XRF instruments measure lead in paint by directing high energy X-rays and gamma rays into the paint, causing the lead atoms in the paint to emit X-rays which are detected by the instrument and converted to a measurement of the amount of lead in the paint. Chemical test kits

detect the presence of lead in paint by a chemical reaction that occurs when chemicals in the kit are exposed to lead. This reaction causes a color change to occur if lead is present in the paint.

Laboratory spectroscopic analysis of paint samples was conducted to determine the actual levels of lead in the paint. The laboratory results were used as a benchmark for comparison to the XRF and test kit results.

STUDY OBJECTIVES

The overall study goal was to collect information about field measurement methodologies sufficient to allow EPA and HUD to establish guidance and protocols for lead hazard identification and evaluation. In order to achieve that goal, the study had to be designed and conducted with sufficient rigor and appropriate quality assurance.

To ensure adequacy of the resulting data, six specific study objectives were developed: three primary and three secondary. The results are presented in this report in two ways: overall conclusions and testing recommendations are made in light of the overall study goal, and results are provided in terms of the specific study objectives.

The three primary study objectives were: (1) to characterize the performance (precision and accuracy) of portable XRF instruments under field conditions; (2) to evaluate the effect on XRF performance of interference from the material (the substrate) underlying the paint; and (3) to characterize the relationship between test kit results and the actual lead level in the paint (operating characteristic curves).

The three secondary study objectives were: (4) to understand XRF behavior in the field through the investigation of XRF measurements that were very different than their corresponding lab result; (5) to evaluate field quality assurance and control methods; and (6) to investigate the variability of lead levels in the paint within the study sampling locations.

FIELD TESTING

Three primary concerns of the field testing portion of the study were consistency, real world comparability, and quality control. Due to the differences among the three measurement methods: XRF, test kits, and laboratory analysis, field testing

approaches necessarily varied somewhat. In order to ensure consistency, testing was standardized as much as possible. A template was designed for test locations throughout the study housing units, and the different measurement methods were systematically assigned to consistent test locations within the template. This approach ensured results could be compared across different test locations and measurement methods.

At each test location, chemical test kits were tested first. The individuals who did the field testing of the test kits were selected to represent typical homeowners who might purchase test kits for their personal use. That is, they did not have any specific scientific background nor prior training. To further replicate “real world” use, the test kits were rotated among the testers during the study. One of the test kits was an exception to this. It was a kit which is only used by state-certified inspectors. For that kit, a state-certified inspector was brought in and that particular kit was not included in the kit rotation. After each tester completed a test location, the used area of the template was covered to prevent subsequent testers from observing the results obtained by prior testers.

Once test kit testing was finished, paint samples were taken. Paint was removed from a specified location on the template and sent to a laboratory for spectroscopic analysis. A modified NIOSH method 7082 was followed with all appropriate quality control samples including laboratory and field duplicates.

XRF testing was the final step in the field portion of the study. It was conducted by trained and licensed XRF instrument operators employed by independent testing companies. XRF testing was carried out on the portions of the templates designated for this purpose. A number of quality control procedures were employed, including the use of National Institute of Standards and Technology (NIST) Standard Reference Material (SRM) paint films. The NIST SRM paint film is a thin layer of paint with a known level of lead enclosed between two layers of plastic. A portion of the template was scraped bare of paint, revealing the material underneath the paint, the substrate, which was either brick, concrete, drywall, metal, plaster or wood. The NIST SRM paint film was placed on the bare substrate and a reading was taken in order to determine if the substrate interfered with the XRF reading. In addition, blocks of known substrate materials, called control blocks, were utilized in the field. The NIST SRM paint film was placed on the appropriate block and XRF readings taken in order to determine if control block substrates could be surrogates for the substrates underlying the painted areas tested.

STUDY RESULTS:

Laboratory Analysis Results

There were two key results of the laboratory analyses. First, laboratory analysis results exhibited a wide range of lead levels with a distribution similar to that reported in the 1990 HUD National Survey of Lead-Based Paint in Housing. Second, lead levels appear to vary significantly across the same painted surface.

Two federal thresholds have been established to define lead-based paint on painted architectural components. If paint is found to contain lead equal to or greater than these thresholds, it is characterized as lead-based paint. The federal threshold in milligrams lead per unit area is 1.0 mg/cm^2 . The federal threshold in percent lead by weight is 0.5%. Approximately 20% of the samples analyzed in this study were equal to or greater than the federal threshold of 1.0 mg/cm^2 , while 29% were equal to or greater than the federal threshold of 0.5% lead. A rough numerical equivalence between results reported as mass of lead per unit area (mg/cm^2) and as percent lead by weight (%) was found in the study data. That is, 1.0 mg/cm^2 lead was found to be roughly equivalent to 1% lead by weight.

The variability of a set of test results is the extent to which the results in the set differ from one another. The standard deviation is a statistical measure of the extent that actual test results tend to spread about an average value. The typical relative standard deviation for laboratory analytical measurements in the study samples was 13%. Variability between field duplicate samples, taken nine inches apart at a subset of test locations, was much larger, between 30% - 60%, indicating significant variability in lead levels across the same painted surface. The statistical analysis of the data took variability in lead levels into account.

Chemical Test Kit Results

The primary result of the test kit evaluation is that they varied widely in their performance in classifying paint against either the 1.0 mg/cm^2 or 0.5% threshold. No single kit achieved a low rate of both false positive and false negative results and their performance varied across substrates.

A false negative result occurs when the kit fails to detect the presence of lead in paint equal to or greater than the federal threshold, but in fact, the paint is shown by

laboratory analysis to contain lead equal to or greater than the threshold. Similarly, a false positive result occurs when the kit detects lead equal to or greater than the federal threshold, but laboratory analysis shows that the paint does not contain lead equal to or greater than the threshold.

No kit in the study achieved low rates of both false positive and false negative results. Two out of six kits were prone to false negative results. Negative test results obtained with these two kits do not necessarily indicate the absence of lead. The other four kits had a tendency to produce false positive results, even at levels of lead well below the federal thresholds.

Further, the performance of the test kits varied with different types of substrates. Most kits usually produced a positive result on at least one substrate, even for very low lead levels. This suggests positive interferences with the chemicals in the kits. On the other hand, some test kits demonstrated negative interferences on some substrates, as indicated by not always giving a positive result for high levels of lead.

XRF Results

The primary result of the XRF testing is that K-shell instruments were often effective in classifying paint samples against the federal threshold of 1.0 mg/cm^2 , when using an inconclusive classification range, laboratory confirmation, and substrate correction, as needed. Generally, L-shell instruments had extremely high false negative rates, making them ineffective in classifying paint against the 1.0 mg/cm^2 threshold.

In this study, measurement bias, or bias, is the tendency of a set of test results to be either greater or less than the laboratory measurements of the lead content of the paint. If test results tending to be greater than the laboratory results, they are said to exhibit positive bias. If the test results tending to be less than the laboratory results, they exhibit negative bias. Results of tests using XRF instruments showed both positive and negative bias. Biases of the K-shell XRF instruments were strongly dependent on the underlying substrate. One K-shell instrument exhibited much less bias than the other XRF instruments. L-shell instruments generally had large negative biases at the 1.0 mg/cm^2 threshold that were usually independent of the substrate.

Substrate correction, using NIST SRM readings on either the scraped substrates or the control blocks, did not reduce bias for L-shell instruments. For K-shell instruments, results were mixed. Control block correction reduced bias for two

instruments on some substrates. Correction using NIST SRM readings on the scraped substrate was effective for two instruments on most substrates, and for another instrument on some substrates.

The variability of the results from each XRF instrument was estimated by calculating a standard deviation. The results of most K-shell instruments exhibited high variability at the federal threshold of 1.0 mg/cm^2 . The variability in the results from the L-shell instruments was significantly lower than that of K-shell instruments.

Despite their generally high variability and bias, K-shell instruments were often effective in classifying the paint samples in this study against the federal threshold of 1.0 mg/cm^2 when using an inconclusive classification range of 0.4 to 1.6 mg/cm^2 with mandatory laboratory confirmation. Without using an inconclusive range and laboratory confirmation, only two of the K-shell instruments had both false positive and false negative rates below 10%.

Generally, L-shell instruments had extremely high false negative rates. One L-shell instrument had moderate to high false negative rates, depending on the width of the inconclusive range, but still gave low readings on some samples with high levels of lead.

OVERALL RECOMMENDATIONS FOR TESTING

XRF Instrument Conclusions

The primary XRF conclusion is that testing by K-shell XRF instruments, with laboratory confirmation of inconclusive XRF results, and with substrate correction in cases where this is effective in reducing bias, is a viable way to test for lead-based paint. This approach can produce satisfactory results for classifying the paint on architectural components using the federal threshold of 1.0 mg/cm^2 .

Further, the variability found in paint samples located approximately nine inches apart supports the conclusion that the most effective method of XRF testing of a single architectural component, such as a window sill, wall, or door, is to obtain readings at different points on the component, and compute their average. This would replace the current practice which is to average a number of XRF readings taken at a single point.

Chemical Test Kit Conclusions

The conclusion of this study is that test kits should not be used for lead paint testing. Test kits cannot determine the extent of lead-based paint in a home and the need for protecting the occupants, especially when repairs or renovations are carried out. Homeowners and renters cannot be confident that test kits will discriminate accurately between lead-based paint and non-lead based paint. They should not make decisions on repairs, renovations or abatements based on test kit results.

DATA DOCUMENTATION

This document provides documentation of the data files from the study and is intended to be used by researchers interested in conducting further analyses of the data.

1.0 INTRODUCTION

Three reports have been developed from the study outlined in the executive summary. This is the data documentation report. The summary report, entitled *A Field Test of Lead-Based Paint Testing Technologies: Summary Report* (EPA 747-R-95-002a), contains an overview of the results from the study. For readers that are interested in more technical detail on the study, there is a comprehensive technical report available: *A Field Test of Lead-Based Paint Testing Technologies: Technical Report* (EPA 747-R-95-002b). The summary report is available from the National Lead Information Center Clearinghouse (1-800-424-LEAD). The technical report is available from the National Technical Information Service (NTIS) by calling 703-487-4650, and requesting the report by its NTIS reference number, PB96-125026.

Data stored in eight analysis data sets, that were created from data collected in this study, are provided as well as descriptions of the eight data sets. These data are stored as ASCII files and were used for the statistical analysis of this study. In all cases, one or more spaces are used as delimiters in the data sets. The quality assurance procedures used on these data sets are provided in Chapter 7 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report* (EPA 747-R-95-002b). Sections 2 through 9 below provide detailed descriptions of the eight data sets including the standard record layouts of each and their corresponding data field definitions. The names and a brief description of each data set are given below.

<u>Data Set</u>	<u>Brief Description of Stored Data</u>
SAM_DEF	Sample definition and location information for data collected in Denver, Philadelphia and Louisville (discussed in section 2.0)
TEST_KIT	Chemical test kit measurement results for data collected in Denver, Philadelphia and Louisville (section 3.0)
XRF_NORM	XRF readings excluding control readings for data collected in Denver and Philadelphia (section 4.0)
PLT_NORM	XRF readings excluding control readings for data collected in Louisville (section 5.0)
XRF_CTRL	XRF control readings for data collected in Denver and Philadelphia (section 6.0)
PLT_CTRL	XRF control readings for data collected in Louisville (section 7.0)

<u>Data Set</u>	<u>Brief Description of Stored Data</u>
LAB_ICP	Laboratory ICP analysis results of paint-chip samples for data collected in Denver, Philadelphia and Louisville (section 8.0)
HUM_TEMP	Humidity and temperature data collected while in Denver and Philadelphia (section 9.0)

The data stored in these data sets matches that reported on the original hand-written field data sheets with the exception of those data listed in section 10 of this report, which were changed due to comparisons with electronically stored data. Several of the XRF instruments that were used in this study stored XRF data electronically. The electronically stored data are not listed in this report but were used for comparisons to the original hand-written field data sheets. Data that were changed due to errors identified from comparing electronically stored data to the original hand-written data sheets are documented in section 10.

Section 11 describes records earmarked for removal from the primary analysis data sets. A flag variable appears in the TEST_KIT, XRF_NORM, XRF_CTRL, and LAB_ICP data sets which identifies records for removal from the primary study analysis data sets. This flag would be set if, for example, an XRF measurement was interrupted due to a power failure and the measurement was taken again once power was restored. The first measurement would be flagged for removal while the second measurement would be used for analyses. A complete list of the records flagged for removal is provided in section 11. A description of why each record was so designated is also provided.

Section 12 provides corrections to errata identified in the report *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

1.1 Identification Numbers

Seven of the eight data sets listed above use a similar system for identifying where measurements were taken. The HUM_TEMP data set is the exception. The SAM_DEF, TEST_KIT, XRF_NORM, PLT_NORM, and LAB_ICP data sets use the identification number that was assigned to each sample location in Denver, Philadelphia, and Louisville. These identification numbers have common ranges so that the identification number may be used to identify the city or dwelling from which the

data were taken and to map between data sets. Similarly, the control data sets (XRF_CTRL and PLT_CTRL) have identification numbers that identifies the city or dwelling from which the data were taken. Identification numbers in the control data sets are different from those in the other data sets because XRF control readings were taken at standardized central locations on control blocks and not on the study sample locations. For a detailed discussion about XRF testing procedures see section 3.5 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

Data from Denver have identification numbers ranging from 80001 to 80999. Data from Philadelphia have identification numbers ranging from 81000 to 81999. The identification numbers for data from Louisville range from 905501 to 905625. Table 1 shows the identification number ranges for each dwelling (see section 2.2) in each of the three cities in the study.

Table 1. Lower and Upper Bounds of Identification Number Ranges for Sample and Control Locations Categorized by City and Dwelling.

CITY	DWELLING	SAMPLE LOCATION RANGE BOUNDS		CONTROL LOCATION RANGE BOUNDS	
		Lower	Upper	Lower	Upper
Denver	1	80001	80075	80080	80099
	2	80101	80175	80180	80194
	3	80205	80279	80280	80297
	4	80305	80379	80380	80397
	5	80405	80479	80480	80496
	6	80505	80579	80580	80594
	7	80605	80679	80680	80693
	8	80705	80779	80780	80795
	9	80805	80879	80880	80896
	10	80905	80979	80980	80994

Louisville	1	905501	905552	905553	905558
	2	905560	905619	905620	905625

1.2 Technologies

Three technologies were in the study: chemical test kits, portable X-ray fluorescence (XRF) instruments, and laboratory analysis of paint samples. Chemical test kits detect the presence of lead in paint by a chemical reaction that occurs when chemicals in the kit are exposed to lead. This reaction causes a color change to occur if lead is present in the paint. The test kits in the study represented the range of kits available at the time the study was conducted. Test kits from five different manufacturers were examined in this study: three rhodizonate based kits, two sodium sulfide based kits, and one proprietary kit. Both of the most common types of chemical test kits, rhodizonate based kits and sodium sulfide based kits, were used in the pilot study. The rhodizonate kits included were LeadCheck (also called LeadCheck II) and the sanding and coring versions of Lead Alert; the sodium sulfide kits were Lead Detective and the Massachusetts state-approved kit. The pilot study also included the Lead Zone kit, which utilizes proprietary chemistry. It was expected that the results of the pilot study would be similar for kits based on similar chemistry, that is, rhodizonate or sodium sulfide, so that fewer kits would need to be included in the full study. However, the test results were not similar for kits utilizing similar chemistry, so the same six kits were included in the full study.

Portable XRF instruments direct high energy X-rays and gamma rays into paint. These high-energy rays strike lead atoms, causing electrons to be ejected from their electron orbits, or shells. In a process called fluorescence, other electrons refill the voids left by the ejected electrons, producing X-rays. These X-rays have specific frequencies based on differences in energy between the electron shells which contained the emitted electrons and the electron shells which received the electrons. The amount of X-ray energy emitted at several specific frequencies, in this case called K-shell or L-shell X-ray energy, is measured by detectors on XRF instruments and used to calculate the amount of lead in paint.

XRF instruments are classified by the type of X-ray energy that they detect, K-shell X-rays, L-shell X-rays, or both. K-shell X-rays are more highly penetrating than L-shell X-rays since L-shell X-rays have lower energy. For this reason, K-shell X-rays are more useful for detecting lead in deeper layers of paint. Two of the XRF instruments in this study detected K-shell X-rays, two XRF instruments detected L-shell X-rays, and two instruments detected both K-shell and L-shell X-rays.

Efforts were made to include a representative example of every XRF instrument available at the time of the study. Six types of XRF instruments were in the study. The

MAP-3, the Microlead I, and the XK-3 were included because they were the most commonly used instruments for LBP testing when the study began. The X-MET 880 was included because it performed successfully in the pilot study. After completion of the pilot study, all other known manufacturers of XRF instruments or working prototypes were invited to participate in a day of ruggedness testing to determine whether the instruments were portable and could function reliably throughout a full day of field testing. As a result, two additional instruments, the Lead Analyzer and a prototype of the XL, were included in the full study. Since the conclusion of the field portion of the study, new XRF instruments and modified versions of some tested instruments have become commercially available.

The third type of technology in the study was laboratory analysis which was used to verify results obtained by the two field technologies: chemical test kits and XRF instruments. For this study, the laboratory instrument used was an atomic emission spectrophotometer. The laboratory procedure involved dissolving paint samples in acid, then filtering and diluting them. A portion of the dissolved sample was placed in the spectrophotometer and heated to extremely high temperatures by a device inside the spectrophotometer called a high temperature atomizer. At very high temperatures, most of the sample is broken down into individual atoms. Individual atoms absorb and re-emit energy produced by the atomizer. Atoms of different chemical elements re-emit energy at different energy levels. A detector in the spectrophotometer sorts and measures the energy re-emitted by the atoms of different chemical elements. In this way, the amount of energy re-emitted by lead atoms is measured and then used to calculate the amount of lead in the sample. The particular type of spectrophotometer used in this study was an inductively coupled plasma atomic emission spectrophotometer (ICP). The analytical laboratory results were continually evaluated by using reference materials to assure the accuracy of the laboratory analysis of field samples.

Chemical test kit results were reported as either negative or positive indicating the absence of lead or presence of lead, respectively. XRF instruments and laboratory analysis results were reported as quantitative measures of lead. XRF instruments report their results as mass of lead per unit area (mg/cm^2). Laboratory analysis results were reported both as mass of lead per unit area (mg/cm^2) and percent lead by weight (%).

2.0 SAM_DEF: SAMPLE DEFINITION DATA SET

There are fourteen (14) data fields per record in the sample definition (SAM_DEF) data set containing data describing sample locations in Denver, Philadelphia, and Louisville. In general, this data set contains data that characterizes the sample location such as the component, substrate, and the color of the paint. Descriptions and names of the data fields along with their widths, columns, and variable types are given in section 2.1. Section 2.2 provides data definitions for each data field identified in section 2.1.

2.1 SAM_DEF: Standard Record Layout

<u>Description</u>	<u>Name</u>	<u>Width</u>	<u>Columns</u>	<u>Type</u>
Identification number	IDNO	6	3 - 8	Integer
Address code	ADDRESS	2	10 - 11	Integer
Dwelling code	DWELLING	2	13 - 14	Integer
Location code	LOCATE	2	16 - 17	Integer
Wall	WALL	1	19	Alpha
Component code	COMP	2	21 - 22	Integer
Substrate type code	SUB	1	24	Alpha
Sample type	TYPE	1	26	Integer
Side-by-side code	SBS	1	28	Integer
Component color code	COLOR	2	30 - 31	Integer
Texture code	TEXTURE	1	33	Integer
Height code	UP_DOWN	2	35 - 36	Integer
Five foot line code	FIVE_FT	1	38	Alpha
Comment	COMMENT	50	40 - 89	Alpha

2.2 SAM_DEF: Data Definitions

IDNO: Identification number assigned to each sample location (see section 1.1).

ADDRESS: The codes 1 through 14 were used to indicate address where the sample site was located. In Denver, where ten single-family houses were tested, the codes 1 through 10 were used to designate the ten addresses. In Philadelphia, where the eight units tested were in two buildings, the codes 11 and 12 were used to designate the two addresses. Similarly, in Louisville, where the four units tested were in two buildings, the codes 13 and 14 were used to

2.2 SAM_DEF: Data Definitions (cont.)

designate the two addresses. For a discussion about site selection see section 3.1.1 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

DWELLING: Ten dwelling codes were used to indicate the actual unit within an address where the sample site was located. The dwelling codes 1 through 10 were used in Denver; one for each single-family house. These dwelling codes are the same as the address codes since, in Denver, all testing was done in single-family housing. In Philadelphia, the dwelling codes 1 through 8 were used. The first four (1 through 4) were in address 11 and the latter four (5 through 8) were in address 12. In Louisville, two living quarters were treated as one dwelling. Thus, dwelling code 1 was in address 13 and dwelling code 2 was in address 14.

LOCATE: Twenty-seven (27) location codes were used to identify the room in which each sample was located and are given below. To identify multiple bedrooms within a dwelling, each bedroom was assigned either a #1, #2, or #3. In Denver and Louisville the bedrooms were given the number indicated on the floor plans provided by the appropriate public housing authority. In Philadelphia two bedroom units, the front bedroom was assigned #1 and the back bedroom was assigned #2. For Philadelphia three bedroom units the front bedroom was assigned #1, the inside wall back bedroom was assigned #2, and the outside wall back bedroom was assigned #3.

2.2 SAM_DEF: Data Definitions (cont.)

<u>Code</u>	<u>Location Description</u>	<u>Code</u>	<u>Location Description</u>
1	Kitchen	15	Exterior (general)
2	Living room/front room	16	Utility room
3	Bathroom	17	Kitchen/hall
4	Bedroom #1	18	Dining room
5	Bedroom #2	19	Garage
6	Bedroom #3	20	Closet: front room
7	Hall	21	Basement
8	Stairway	22	Closet: bedroom #1
9	Front porch	23	Closet: bedroom #2
10	Back porch	24	Closet: bedroom #3
11	Upstairs porch	25	Closet: hall
12	Kitchen/living room	26	Shed
13	Living room/stairway	99	Unknown
14	Bathroom/hall		

WALL: Four wall codes were used. Wall A was assigned to the wall that was oriented to the front of the house or unit and parallel to the front wall. Walls B through D were assigned to each wall in a clockwise manner from wall A. The following codes were assigned to the walls.

<u>Code</u>	<u>Relative Wall Location</u>
A	Parallel to the front side of house or unit
B	Assigned 1 st in a clockwise manner from A
C	Assigned 2 nd in a clockwise manner from B
D	Assigned 3 rd in a clockwise manner from C

COMP: Fifty-one component codes were used. For a discussion about component selection see section 3.1.2 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

2.2 SAM_DEF: Data Definitions (cont.)

<u>Code</u>	<u>Component Description</u>	<u>Code</u>	<u>Component Description</u>
1	Door frame: exterior	27	Gutter
2	Door frame	28	Downspout
3	Door: exterior	29	Door jamb
4	Door: interior	30	Door casing
5	Window sill: exterior	31	Door
6	Window sill: interior	32	Window sill
7	Window casing	33	Window sash
8	Bar top	34	Facia
9	Threshold	35	Shutter
10	Shelf	36	Header
11	Closet wall	37	Drawer
12	Shelf support	38	Cabinet
13	Wall trim	39	Closet door
14	Wall	40	Closet shelf
15	Support column	41	Foundation
16	Ceiling beam	42	Mail box or slot
17	Ceiling hatch door	43	Heating register
18	Floor baseboard	44	Pipe
19	Electrical box cover	45	Plumbing access
20	Duct	46	Rafter support
21	Stair riser	47	Rafter
22	Stair stringer	48	Floor
23	Coat rack support	49	Roof flashing
24	Medicine cabinet interior	50	Closet baseboard
25	Side of bar	51	Awning
26	Railing cap		

SUB: Data was collected from six substrates. For a discussion about substrate selection see section 3.1.3 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*. The following codes were assigned to each substrate.

2.2 SAM_DEF: Data Definitions (cont.)

<u>Code</u>	<u>Substrate</u>	<u>Code</u>	<u>Substrate</u>
B	Brick	M	Metal
C	Concrete	P	Plaster
D	Drywall	W	Wood

TYPE: Type codes were used to identify different categories of XRF readings. Codes 1 through 3 are assigned to the standard, special, and "special-special" XRF reading categories, respectively. Standard readings are described in section 3.5.2.6 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*. Special and special-special readings are described in section 3.5.2.7 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

SBS: A code of 0 indicates the sample is not a field duplicate paint-chip sample (side-by-side), while a code of 1 indicates that it is. For a discussion about field duplicates see section 3.2.2.3 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

2.2 SAM_DEF: Data Definitions (cont.)

COLOR: The following codes list the observed colors on the painted surfaces.

<u>Code</u>	<u>Color</u>	<u>Code</u>	<u>Color</u>
1	Brown	8	Silver
2	White	9	Green
3	Beige	10	Grey
4	Blue	11	Black
5	Yellow	12	Tan
6	Pink	13	Orange
7	Red		

TEXTURE: Surface texture data were collected at the Denver and Philadelphia sample locations. Texture data were not collected in Louisville. The texture data collected in Denver were deemed unreliable and removed from this data set. The Philadelphia sample location's texture was rated on a scale from 1 to 3, with 1 being smooth and 3 being rough.

UP_DOWN: The UP_DOWN variable pertains to doors and door frames in Philadelphia only. This is because Philadelphia was the only site with indications of lead abatement on doors and door frames below 5 feet. A sample location received the code 1 if it was above five feet, the code -1 if it was below five feet, and the code 0 if it straddled the five foot line.

FIVE_FT: The FIVE_FT variable also only pertains to doors and door frames in Philadelphia for the reason stated above. A sample received the code Y if there were indications of lead abatement below five feet, and N, otherwise.

COMMENT: Miscellaneous comments about the sample or location.

3.0 TEST_KIT: CHEMICAL TEST KIT MEASUREMENT DATA SET

There are nine (9) data fields per record in the test kit results (TEST_KIT) data set containing data from Denver, Philadelphia, and Louisville. Descriptions and names of the data fields along with their widths, columns, and variable types are given in section 3.1. Section 3.2 provides data definitions for each data field identified in section 3.1.

3.1 TEST_KIT: Standard Record Layout

<u>Description</u>	<u>Name</u>	<u>Width</u>	<u>Columns</u>	<u>Type</u>
Omission flag	OMIT	1	1	Alpha
Identification number	IDNO	6	3 - 8	Integer
Date	DATE	8	10 - 17	Date
Name of test kit	KIT	1	19	Integer
Field sampler code	PERSON	2	21 - 22	Integer
Start time	S_TIME	5	24 - 28	Time
Time of observation	E_TIME	5	30 - 34	Time
LBP determination code	RESULT	1	36	Integer
Shade of result	SHADE	1	38	Integer

3.2 TEST_KIT: Data Definitions

OMIT: Flags records to be omitted from the primary study analyses. See section 10.0 for a discussion about the omission flag.

IDNO: Identification number assigned to the sample location (see section 1.1).

DATE: The date of data collection is stored using the following format: MM/DD/YY. For example, July 31, 1993 is stored as 07/31/93.

KIT: Six test kits were used. For a discussion about test kit selection see section 3.4.1 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*. The following codes were assigned to the test kits.

3.2 TEST_KIT: Data Definitions (cont.)

<u>Code</u>	<u>Test Kit Name</u>	<u>Code</u>	<u>Test Kit Name</u>
1	LeadCheck	4	Lead Alert: Coring
2	Lead Alert: Sanding	5	Lead Detective
3	Lead Zone	6	State Sodium Sulfide

PERSON: Codes 1 through 19 were assigned to the individuals collecting test kit data. For a discussion about test kit testing personnel see section 3.4.2.3 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

S_TIME: The four digit 24 hour clock military time (including the colon) is the start time of data collection. For example, 3:24 PM would be stored as 15:24.

E_TIME: The time of observation; stored in military time format (including the colon).

RESULT: The observed test kit result recorded as the values 0 and 1 for negative and positive, respectively.

SHADE: The degree or intensity of positive results reported on a scale of 1 to 5 for the Lead Detective and State Sodium Sulfide test kits only.

4.0 XRF_NORM: XRF MEASUREMENT DATA SET

There are twenty-three (23) data fields per record in the XRF reading (XRF_NORM) data set containing data collected in Denver and Philadelphia. Descriptions and names of the data fields in the full study data set along with their widths, columns, and variable types are given in section 4.1. Section 4.2 provides data definitions for each data field identified in section 4.1.

4.1 XRF_NORM: Standard Record Layout

<u>Description</u>	<u>Name</u>	<u>Width</u>	<u>Columns</u>	<u>Type</u>
Omission flag	OMIT	1	1	Alpha
Identification number	IDNO	6	3 - 8	Integer
Date	DATE	8	10 - 17	Date
XRF instrument	INSTR	1	19	Integer
Operator	OPERATOR	2	21 - 22	Integer
XRF machine identifier	XRF_ID	1	24 - 25	Integer
Monitor	MONITOR	2	27 - 28	Integer
Reading shell	SHELL	1	30	Alpha
Length of reading	LENGTH	1	32	Integer
Time of observation	TIME	5	34 - 38	Time
1st paint reading	PNT_1	7	40 - 46	Real
2nd paint reading	PNT_2	7	48 - 54	Real
3rd paint reading	PNT_3	7	55 - 62	Real
1st red (1.02) film	RED_1	7	64 - 70	Real
2nd red (1.02) film	RED_2	7	72 - 78	Real
3rd red (1.02) film	RED_3	7	80 - 86	Real
1st bare reading	BARE_1	7	88 - 94	Real
2nd bare reading	BARE_2	7	96 -102	Real
3rd bare reading	BARE_3	7	104-110	Real
Additional information	ADD_INFO	4	112-114	Real
Serial number code	SER_ID	2	117-118	Integer

4.2 XRF_NORM: Data Definitions

OMIT: Flags records to be omitted from the primary study analyses. See section 10.0 for a discussion about the omission flag.

IDNO: Identification number assigned to the sample location (see section 1.1).

4.2 XRF_NORM: Data Definitions (cont.)

DATE: Date of data collection using the following format: MM/DD/YY.

INSTR: Six XRF instruments were used. For a discussion about XRF instrument selection see section 3.5.1 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*. The following codes were assigned to each XRF instrument.

<u>Code</u>	<u>Instrument</u>	<u>Code</u>	<u>Instrument</u>
1	XL prototype	4	MAP-3
2	X-MET 880	5	Pb Analyzer
3	XK-3	6	Microlead I

OPERATOR: Eleven codes, A through N, were assigned to each of the XRF operators. For a discussion about the XRF operator selection see section 3.5.2.1 and Table 6-10 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

XRF_ID: Multiple instruments from the same manufacturer were present in the field. Field classifications were developed using the Roman numerals I and II to differentiate between these multiple instruments. Also, for data collection and analysis purposes, XRF instruments that provided both K-shell and L-shell readings were classified as two distinct instruments. For a discussion about XRF instrument selection see section 3.5.1 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*. The following codes were assigned to each of the field classifications.

<u>Code</u>	<u>Device</u>	<u>Code</u>	<u>Device</u>
1	XL prototype	7	MAP-3 K-shell (II)
2	X-MET 880	8	MAP-3 L-shell (II)
3	XK-3 (I)	9	Pb Analyzer K-shell
4	XK-3 (II)	10	Pb Analyzer L-shell
5	MAP-3 K-shell (I)	11	Microlead I (I)
6	MAP-3 L-shell (I)	12	Microlead I (II)

MONITOR: The codes 1 through 21 were assigned to the twenty-one monitors selected to record XRF readings and to observe the XRF operator. For a discussion about the XRF monitor selection see section 3.5.2.1 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

4.2 XRF_NORM: Data Definitions (cont.)

SHELL: A letter, either K or L that indicates which shell the detected energy originated from.

LENGTH: Three different XRF reading times were used during XRF testing. Only the MAP-3 instruments were assigned codes 2 and 3 (which are the test and confirm modes, respectively, for that instrument). For a discussion about alternative XRF reading times see section 3.5.2.7 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*. The following codes were assigned to each of the reading times.

<u>Code</u>	<u>Length</u>
1	Nominal 15-second
2	Nominal 60-second
3	Nominal 240-second

TIME: The four digit 24 hour clock military time (including the colon) is the start time of the series of XRF readings for the sample location.

PNT_*i*: XRF readings taken on the painted surface where *i* is 1, 2, or 3. Up to three XRF readings were taken on the painted surface of the sampling location and were recorded in the order taken. For a discussion about XRF measurement design see section 3.5.2 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

RED_*i*: XRF readings using the red NIST SRM film where *i* is 1, 2, or 3. Up to three XRF readings were taken on the bare substrate area of the sampling location covered with the NIST SRM red (1.02 mg/cm²) film (recorded in the order taken).

BARE_*i*: XRF readings on the bare substrate where *i* is 1, 2, or 3. Up to three XRF readings were taken on the bare substrate area of the sampling location (recorded in the order taken). These XRF readings were only taken on samples designated "special" or "special-special".

ADD_INFO: Specific additional information that was collected from the Microlead I and XL instruments. Density measurements of the substrate were collected from the Microlead I instruments at approximately 13% of the Denver sample locations and approximately 95% of the Philadelphia sample locations. The absorption rate was collected with the XL prototype from approximately 15% of the Denver sample locations and approximately 95% of the Philadelphia sample locations.

4.2 XRF_NORM: Data Definitions (cont.)

SER_ID: The serial number of each XRF instrument was coded using two digits. Table 6-1 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report* provides the XRF instrument serial number codes.

5.0 PLT_NORM: PILOT XRF MEASUREMENT DATA SET

There are twenty-one (21) data fields per record in the pilot XRF reading (PLT_NORM) data set containing data collected in Louisville only. The XRF data collected in Louisville differed enough from the XRF data collected in Denver and Philadelphia (stored in the XRF_NORM data set) to warrant a separate data set. Descriptions and names of the data fields in the PLT_NORM data set along with their widths, columns, and variable types are given in section 5.1. Section 5.2 provides data definitions for each data field identified in section 5.1.

5.1 PLT_NORM: Standard Record Layout

<u>Description</u>	<u>Name</u>	<u>Width</u>	<u>Columns</u>	<u>Type</u>
Identification number	IDNO	6	1 - 6	Integer
Date	DATE	6	8 - 13	Date
XRF machine identifier	XRF_ID	1	15	Integer
Length	LENGTH	1	17	Integer
Time of observation	TIME	5	19- 23	Time
Substrate type code	SUB	1	25	Alpha
Type of reading	TYPE	2	27- 28	Integer
1st paint reading	PNT_1	6	30- 35	Real
2nd paint reading	PNT_2	6	37- 42	Real
3rd paint reading	PNT_3	6	44- 49	Real
4th paint reading	PNT_4	6	51- 56	Real
1st red (1.02) film	RED_1	6	58- 63	Real
2nd red (1.02) film	RED_2	6	65- 70	Real
3rd red (1.02) film	RED_3	6	72- 77	Real
4th red (1.02) film	RED_4	6	79- 84	Real
1st yellow (3.53) film	YEL_1	6	86- 91	Real
2nd yellow (3.53) film	YEL_2	6	93- 98	Real
3rd yellow (3.53) film	YEL_3	6	99-105	Real
4th yellow (3.53) film	YEL_4	6	107-112	Real
Normal density	DEN_1	3	114-117	Real
Red film density	DEN_2	3	119-122	Real
Yellow film density	DEN_3	3	124-127	Real

5.2 PLT_NORM: Data Definitions

IDNO: Identification number assigned to each sample location (see section 1.1).

DATE: The date of data collection is recorded using the following format: MMDDYY. Note that this date format is different from previous data sets.

XRF_ID: Four XRF instruments were used. However, one of these instruments provided both K-shell and L-shell readings. For data collection and analysis purposes, results from this instrument were classified as coming from two distinct instruments. Thus, five codes were used. For a discussion about XRF instrument selection see section 3.5.1 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*. The following codes were assigned to each XRF instrument.

<u>Code</u>	<u>Instrument</u>
1	X-MET 880
2	XK-3
3	MAP-3 K-shell
4	MAP-3 L-shell
5	Microlead I

LENGTH: Two different XRF reading times were used during XRF testing for the pilot study. For a discussion about alternative XRF reading times see section 3.5.2.7 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*. The following codes were assigned to each of the reading times.

<u>Code</u>	<u>Length</u>
1	Nominal 15-second
2	Nominal 60-second

TIME: The four digit 24 hour clock military time (including the colon) is the start time of the series of readings at a sample location.

5.2 PLT_NORM: Data Definitions (cont.)

SUB: Data was collected from six substrates. For a discussion about substrate selection see section 3.1.3 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*. Note that the drywall substrate code is different from the code given drywall in the data sets described above. The following codes were assigned to each substrate.

<u>Code</u>	<u>Substrate</u>	<u>Code</u>	<u>Substrate</u>
B	Brick	M	Metal
C	Concrete	P	Plaster
D	Drywall	W	Wood

TYPE: Type codes were assigned to identify different categories of XRF readings. Standard readings are described in section 3.5.2.6 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*. Special readings are described in section 3.5.2.7 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*. Variability check readings are described in section 3.5.2.4 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*. A reshoot reading is a sample measurement which was re-taken as a result of either a request from the operator or, in the case of the Microlead I, a premature release of the XRF instrument's trigger. The following codes were assigned to the type XRF reading.

<u>Code</u>	<u>Type of Reading</u>
1	Standard
2	Special
3	Variability check
4	Reshoot

PNT_*i*: XRF readings taken on the painted surface where *i* is 1, 2, 3 or 4. Up to four XRF readings were taken on the painted surface of the sampling location (recorded in the order taken). For a discussion about XRF measurement design see section 3.5.2 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

RED_*i*: XRF readings taken using the red NIST SRM film where *i* is 1, 2, 3 or 4. Up to four XRF readings were taken on the bare substrate area of the sampling location that were covered with the NIST SRM red (1.02 mg/cm²) film (recorded in the order taken).

5.2 PLT_NORM: Data Definitions (cont.)

YEL_*i*: XRF readings taken using the yellow NIST SRM film where *i* is 1, 2, 3, or 4. Up to four XRF readings were taken on the bare substrate of concrete sampling locations that were covered with the yellow NIST SRM (3.53 mg/cm²) film (recorded in the order taken).

DEN_*i*: Density measurements where *i* is 1, 2, or 3. These measurements were from the Microlead I for readings taken on 1) paint samples, 2) bare substrate covered with the NIST SRM red (1.02 mg/cm²) film, and 3) bare substrate covered with the NIST SRM yellow (3.53 mg/cm²) film, respectively. Density was collected at approximately 20% of the sample locations in Louisville.

6.0 XRF_CTRL: XRF CONTROL MEASUREMENT DATA SET

There are twenty-two (22) data fields per record in the full study XRF_CTRL data set that contain continuing, initial, and ending control readings from Denver and Philadelphia. Descriptions and names of the data fields in the (full study) XRF_CTRL data set along with their widths, columns, and variable types are given in section 6.1. Section 6.2 provides data definitions for each data field identified in section 6.1.

6.1 XRF_CTRL: Standard Record Layout

<u>Description</u>	<u>Name</u>	<u>Width</u>	<u>Columns</u>	<u>Type</u>
Omission flag	OMIT	1	1	Alpha
Identification no.	IDNO	6	3 - 8	Integer
Date	DATE	8	10 - 17	Date
XRF instrument	INSTR	1	19	Integer
Operator	OPERATOR	1	21 - 22	Integer
XRF machine id.	XRF_ID	2	24 - 25	Integer
Monitor	MONITOR	2	27 - 28	Integer
Substrate	SUB	1	30	Alpha
Type	TYPE	1	32	Integer
Time of observation	TIME	5	34 - 38	Time
Reading shell	SHELL	1	40	Alpha
1st yellow film	YEL_1	7	42 - 48	Real
2nd yellow film	YEL_2	7	50 - 56	Real
3rd yellow film	YEL_3	7	58 - 64	Real
1st red film	RED_1	7	66 - 72	Real
2nd red film	RED_2	7	74 - 80	Real
3rd red film	RED_3	7	82 - 88	Real
1st bare substrate	BARE_1	7	90 - 96	Real
2nd bare substrate	BARE_2	7	98 - 104	Real
3rd bare substrate	BARE_3	7	106 - 112	Real
Serial number code	SER_ID	2	114 - 115	Integer

6.2 XRF_CTRL: Data Definitions

OMIT: Flags records to be omitted from the main study analyses. See section 10.0 for a discussion about the omission flag.

6.2 XRF_CTRL: Data Definitions (cont.)

IDNO: Identification number assigned to each sample location (See section 1.1).

DATE: Date of data collection using the following format: MM/DD/YY.

INSTR: Six XRF instruments were used. For a discussion about XRF instrument selection see section 3.5.1 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*. The following codes were assigned to each XRF instrument.

<u>Code</u>	<u>Instrument</u>	<u>Code</u>	<u>Instrument</u>
1	XL prototype	4	MAP-3
2	X-MET 880	5	Pb Analyzer
3	XK-3	6	Microlead I

OPERATOR: Nine codes, A through N were assigned to each of the XRF operators. For a discussion about the XRF operator selection see section 3.5.2.1 and Table 6-10 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

XRF_ID: Multiple instruments from the same manufacturer were present in the field. Field classifications were developed using the roman numerals I and II to differentiate between these multiple instruments. Also, for data collection and analysis purposes, XRF instruments that provided both K-shell and L-shell readings were classified as two distinct instruments. For a discussion about XRF instrument selection see section 3.5.1 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*. The following codes were assigned to each of the field classifications.

<u>Code</u>	<u>Device</u>	<u>Code</u>	<u>Device</u>
1	XL prototype	7	MAP-3 K-shell (II)
2	X-MET 880	8	MAP-3 L-shell (II)
3	XK-3 (I)	9	Pb Analyzer K-shell
4	XK-3 (II)	10	Pb Analyzer L-shell
5	MAP-3 K-shell (I)	11	Microlead I (I)
6	MAP-3 L-shell (I)	12	Microlead I (II)

MONITOR: The codes 1 through 21 were assigned to the twenty-one monitors selected for XRF testing. For a discussion about the XRF monitor selection see section 3.5.2.1 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

6.2 XRF_CTRL: Data Definitions (cont.)

SUB: Data was collected from six substrates. For a discussion about substrate selection see section 3.1.3 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*. The following codes were assigned to each substrate.

<u>Code</u>	<u>Substrate</u>	<u>Code</u>	<u>Substrate</u>
B	Brick	M	Metal
C	Concrete	P	Plaster
D	Drywall	W	Wood

TYPE: Type codes were assigned to identify different categories of XRF control readings. Control readings are described in section 3.5.2.9 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*. The following codes were assigned to the type of XRF control reading.

<u>Code</u>	<u>Type</u>
1	Continuing control
2	Initial control
3	Ending control

TIME: The four digit 24 hour clock military time (including the colon) is the start time of the series of readings at a sample location.

SHELL: A letter, either K or L, that indicates which shell the detected energy originated from.

YEL_*i*: XRF readings taken using the yellow NIST SRM film where *i* is 1 through 3, inclusive. Up to three 15-second nominal XRF readings were taken on control blocks covered with the NIST SRM yellow (3.53 mg/cm²) film (recorded in the order taken). For a discussion about XRF measurement design see section 3.5.2 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

RED_*i*: XRF readings taken using the red NIST SRM film where *i* is 1 through 3, inclusive. Up to three 15-second nominal XRF readings were taken on control blocks covered with the NIST SRM red (1.02 mg/cm²) film (recorded in the order taken).

6.2 XRF_CTRL: Data Definitions (cont.)

BARE_*i*: XRF readings taken on the bare substrate where *i* is 1 through 3, inclusive. Up to three 15-second nominal XRF readings were taken on bare control blocks (recorded in the order taken).

SER_ID: The serial number of each XRF instrument was coded using two digits. Table 6-1 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report* provides the XRF instrument serial number codes.

7.0 PLT_CTRL: PILOT XRF CONTROL MEASUREMENT DATA SET

There are twenty-four (24) variables per record in the pilot study PLT_CTRL data set that contain initial, continuing, and ending control readings from Louisville only. The XRF control data collected in Louisville differed enough from the XRF control data collected in Denver and Philadelphia (stored in the XRF_CTRL data set) to warrant a separate data set. Descriptions and names of the data fields in the (pilot study) PLT_CTRL data set along with their widths, columns, and variable types are given in section 7.1. Section 7.2 provides data definitions for each data field identified in section 7.1.

7.1 PLT_CTRL: Standard Record Layout

<u>Description</u>	<u>Name</u>	<u>Width</u>	<u>Columns</u>	<u>Type</u>
Identification no.	IDNO	6	1 - 6	Integer
Date	DATE	6	8 - 13	Integer
XRF Instrument code	XRF_ID	1	15	Integer
Type of reading	TYPE	1	17	Integer
Length of reading	LENGTH	1	19	Integer
Time of observation	TIME	5	21- 25	Alpha
Substrate type code	SUB	1	27	Alpha
NIST SRM film level	LEVEL	1	29	Integer
1st control reading	CTRL_1	6	31- 36	Real
2nd control reading	CTRL_2	6	38- 43	Real
3rd control reading	CTRL_3	6	45- 50	Real
4th control reading	CTRL_4	6	52- 57	Real
5th control reading	CTRL_5	6	59- 64	Real
6th control reading	CTRL_6	6	66- 71	Real
7th control reading	CTRL_7	6	73- 78	Real
8th control reading	CTRL_8	6	80- 85	Real
9th control reading	CTRL_9	6	87- 92	Real
Density reading	DENSITY	4	94- 97	Real
Humidity	HUMID	4	99-102	Real
Temperature	TEMP	4	104-107	Real

7.2 PLT_CTRL: Data Definitions

IDNO: Identification number assigned to each sample location (see section 1.1).

DATE: The date of data collection is recorded using the following format: MMDDYY.

XRF_ID: Four XRF instruments were used. However, one of these instruments provided both K-shell and L-shell readings. For data collection and analysis purposes, results from this instrument were classified as coming from two distinct instruments. Thus, five codes were used. For a discussion about XRF instrument selection see section 3.5.1 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*. The following codes were assigned to each XRF instrument.

<u>Code</u>	<u>Instrument</u>
1	X-MET 880
2	XK-3
3	MAP-3 K-shell
4	MAP-3 L-shell
5	Microlead I

TYPE: Type codes were assigned to identify the beginning, continuing, and ending control readings and the reshoot readings. Beginning, continuing, and ending control readings are described in section 3.5.2.9 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*. A reshoot reading is a sample measurement which was re-taken as a result of either a request from the operator or, in the case of the Microlead I, a premature release of the XRF instrument's trigger. The following codes were assigned to the type of XRF reading.

<u>Code</u>	<u>Type of Reading</u>
1	Beginning control
2	Ending control
3	Continuing control
4	Reshoot

7.2 PLT_CTRL: Data Definitions (cont.)

LENGTH: Two different XRF reading times were used during pilot XRF testing. For a discussion about alternative XRF reading times see section 3.5.2.7 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*. The following codes were assigned to each of the XRF reading times.

<u>Code</u>	<u>Length</u>
1	Nominal 15-second
2	Nominal 60-second

TIME: The four digit 24 hour clock military time (including the colon) is the start time of the series of readings.

SUB: Data was collected from six substrates. For a discussion about substrate selection see section 3.1.3 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*. Note that the drywall substrate code is different from the code assigned to drywall in the XRF_NORM and XRF_CTRL data sets described above. The following codes were assigned to each substrate.

<u>Code</u>	<u>Substrate</u>	<u>Code</u>	<u>Substrate</u>
B	Brick	M	Metal
C	Concrete	P	Plaster
D	Drywall	W	Wood

LEVEL: The following codes were assigned to classify NIST SRM paint films.

<u>Code</u>	<u>NIST SRM Film</u>
1	Yellow (3.53 mg lead/cm ²)
2	Red (1.02 mg lead/cm ²)

CTRL_i: XRF control reading code where *i* is 1 through 9, inclusive. These are the XRF control readings which were taken on control blocks covered with a specific level of NIST SRM film. Depending on the instrument, there were from one to nine readings taken (recorded in the order taken). For a discussion about XRF measurement design see section 3.5.2 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

7.2 PLT_CTRL: Data Definitions (cont.)

DENSITY: Density measurements recorded from the Microlead I XRF instrument. Density measurements were collected at approximately 50% of Louisville sample locations.

HUMID: Humidity measurements were taken whenever control readings were taken.

TEMP: Temperature measurement were taken whenever control readings were taken.

8.0 LAB_ICP: LABORATORY ANALYSIS DATA SET

There are nineteen (19) data fields per record in the laboratory analysis (LAB_ICP) data set containing data collected in Denver, Philadelphia, and Louisville. Descriptions and names of the data fields along with their widths, columns, and variable types are given in section 8.1. Section 8.2 provides data definitions for each data field identified in section 8.1.

8.1 LAB_ICP: Standard Record Layout

Description	Name	Width	Columns	Type
Omission flag	OMIT	1	1	Integer
Identification number	IDNO	6	3 - 8	Integer
Duplicate sample flag	DUPE	1	10	Integer
Run number	RUN_NO	3	12 - 14	Integer
Sample description	SAMPLE	11	16 - 26	Alpha
Name	NAME	1	28	Integer
Collection date	DATE_C	6	30 - 35	Date
Analysis date	DATE_A	6	37 - 42	Date
Batch code	BATCH	3	44 - 46	Integer
Laboratory type code	TYPE	2	48 - 49	Integer
Instrumental result	RESULT	7	51 - 57	Real
Final dilution	DILUTE	3	59 - 61	Real
Dilution factor	FACTOR	3	63 - 65	Real
Sub-sample mass	SUB_MASS	6	67 - 72	Real
Total sample mass	TOT_MASS	6	74 - 80	Real
Sample dimension 1	DIMEN_1	3	82 - 84	Real
Sample dimension 2	DIMEN_2	3	86 - 88	Real
True conc. or spike wt.	SPIKE	6	90 - 95	Real
Lead per mass	MG_GRAM	7	97 -103	Real
Lead per cm ²	MG_CM2	8	105 -112	Real
Detection limit	DETECT	1	114	Integer

8.2 LAB_ICP: Data Definitions

OMIT: Flags records to be omitted from the primary study analyses. See section 10.0 for a discussion about the omission flag.

IDNO: Identification number assigned to each sample location (see section 1.1)

DUPE: A code of 0 indicates the sample is a field primary paint-chip sample, while a code of 1 indicates that the sample is a field duplicate sample. For a discussion about field duplicates see section 3.2.2.3 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

RUN_NO: Number assigned by the laboratory to the sample run.

SAMPLE: Laboratory sample description.

NAME: Codes 1 through 9 were assigned to the individuals who collected the paint-chip samples.

DATE_C: The date that the paint-chip sample was collected; recorded in the following format: MMDDYY.

DATE_A: The date that the paint was analyzed in the laboratory is stored using the following format: MMDDYY.

BATCH: Number assigned by the laboratory to the sample batch.

TYPE: Codes describing the type of laboratory sample. For a discussion about paint collection and laboratory analysis design elements see sections 3.2.2 and 3.3.2 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*. The following codes were assigned to each sample type.

<u>Code</u>	<u>Type of Sample</u>
0	Laboratory primary sample
1	Laboratory duplicate sample
2	Field blank sample
3	Lab method blank
4	AIHA ELPAT blind sample
5	AIHA ELPAT blind duplicate sample
6	NIST blind reference material
7	Standard not used for lead
8	Calibration standard

8.2 LAB_ICP: Data Definitions (cont.)

Code	Type of Sample
9	Interferant check standard (ICS) or initial calibration verification (ICV)
10	Continuing calibration verification (CCV)
11	Continuing calibration blank (CCB) or initial calibration blank (ICB)
12	Used for instrumental detection limit calculation
13	Spiked sample
14	Duplicate Spiked Sample
15	Sample has characteristics undesirable for analysis (details given in section 10)

RESULT: Instrumental response in microgram (μg) per sample. For a discussion about laboratory analysis design elements see section 3.3.2 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

DILUTE: Final dilution volume in milliliters. For a discussion about laboratory analysis design elements see section 3.3.2 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

FACTOR: Dilution factors. For a discussion about laboratory analysis design elements see section 3.3.2 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

SUB_MASS: Subsample mass in grams. For a discussion about laboratory analysis design elements see section 3.3.2 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

TOT_MASS: Total sample mass in grams. For a discussion about paint-chip sample collection see section 3.2.2.1 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

DIMEN_1: The first dimension of the rectangular area from which the paint-chip sample was taken. For a discussion about paint-chip collection size see section 3.2.2.1 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

8.2 LAB_ICP: Data Definitions (cont.)

DIMEN_2: The second dimension of the rectangular area from which the paint-chip sample was taken. For a discussion about paint-chip collection size see section 3.2.2.1 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

SPIKE: True concentration or spike weight.

MG_GRAM: Laboratory analysis ICP result reported as milligram lead per gram of sample mass. For a discussion laboratory reported results see section 3.3.2.1 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

MG_CM2: Laboratory analysis ICP result reported in area units as milligram lead per square centimeter (mg/cm^2). For a discussion about laboratory reported results see section 3.3.2.1 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

DETECT: Code to indicate if the reported result is below the instrumental detection limit. If the code is equal to 0 then the reported result exceeds the detection limit. If the code is equal to 1 then the reported result is below the detection limit. For a discussion about laboratory analysis design elements see sections 3.3.2 and 4.4.1 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

9.0 HUM_TEMP: HUMIDITY AND TEMPERATURE DATA SET

There are five (5) data fields per record in the humidity and temperature (HUM_TEMP) data set containing data collected in Denver and Philadelphia. Humidity and temperature data collected in Louisville is stored in the PLT_CTRL data set described above. Descriptions and names of the data fields in the HUM_TEMP data set along with their widths, columns, and variable types are given in section 9.1. Section 9.2 provides data definitions for each data field identified in section 9.1.

9.1 HUM_TEMP: Standard Record Layout

<u>Description</u>	<u>Name</u>	<u>Width</u>	<u>Columns</u>	<u>Type</u>
Date of observation	DATE	8	1 - 8	Date
Time of observation	TIME	5	10 - 14	Time
Address code	ADDRESS	2	16 - 17	Integer
Temperature	TEMP	4	19 - 22	Real
Humidity	HUMID	4	24 - 27	Real

9.2 HUM_TEMP: Data Definitions

DATE: The date that the observations were made; recorded in the following format: MM/DD/YY.

TIME: The four digit 24 hour clock military time (including the colon) is the start time of the series of readings.

ADDRESS: The codes 1 through 12 were used to indicate addresses in Denver and Philadelphia. In Denver, where ten single-family houses were tested, the codes 1 through 10 were used to designate the ten addresses. In Philadelphia, where the eight units tested were at two addresses, the codes 11 and 12 were used to designate the two addresses.

TEMP: Temperature observation recorded whenever control readings were taken.

HUMID: Humidity observation recorded whenever control readings were taken.

10.0 RECORDS WHICH CHANGED DUE TO DATA COMPARISONS

Several of the XRF instruments that were used in this study store data electronically. Four of these instruments, the Pb Analyzer, the MAP-3 instruments, and the X-MET 880 provided electronically stored data which were then compared to the original hand-written field data. A listing of all electronically stored data is not given here, but data that changed due to errors identified through comparisons of hand-written data with the electronically stored data are listed below. XRF instruments are identified by their field classification, as described in previous sections. The column headings are as follows: IDNO is the identification number discussed in previous sections; "Reading" identifies the type of XRF reading which was changed due to the comparison; "Incorrect Value" is the incorrect XRF reading from the original hand-written data sheet; "Correct Value" is the correct XRF reading taken from the XRF instruments' electronically stored results; and "Data Type" is either standard, control, or special which identifies the type of data that was affected by the change. An entry of "miss" in the "Incorrect Value" column indicates that the datum was missing from the original hand-written field data sheet. The data sets described in sections 4 through 9 of this document contain only the corrected data from the lists given below. For a detailed discussion about data comparisons see section 7.3.3 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

11.0 RECORDS FLAGGED FOR OMISSION

A small percentage of records were flagged for easy identification for omission from the primary data analyses. These records were flagged due to various data collection problems or departures from the data collection protocol or because the data were ancillary to the study. Most of these data were re-collected whenever it was possible to do so in the field.

This section provides a description of these flagged records. It was not desirable to permanently delete these records, so the omission flag was established to identify these records. All of records with the omission flag set are documented below with the reason for its omission. Refer to the descriptions of the data sets to interpret the meaning of any codes presented below.

Records were identified for omission using the OMIT variable. The OMIT variable is used in the TEST_KIT, XRF_NORM, XRF_CTRL, and LAB_ICP data sets and is described in the sections for each of these data sets. When a record has the OMIT variable set equal to '*', the record was omitted from the primary analysis data sets. This flag would be set if, for example, an XRF measurement was interrupted due to a power failure. Most likely, a replacement measurement would have been taken once power was restored. The first measurement would be flagged for omission with a "*" while the second measurement would not be flagged and would be used for analyses.

Note that among the list of records flagged for omission from the LAB_ICP data set are records that were part of a preliminary analysis used to determine the optimal sample weight. The data from these records were used in preliminary laboratory analyses, but not for primary study analyses. Further note that there are records flagged for omission because they were analyzed only as a follow-up analysis to examine low NIST SRM recovery rates. For a detailed discussion about these analyses, see section 4.4.2.2.1 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

In the list of records flagged for omission from the TEST_KIT data set are records with data obtained while using a testing solution that was suspect. The suspect results were re-taken and now replace the records flagged for omission. For a discussion about the use of the suspect testing solution, see section 3.4.4.2.2 of *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*.

11.0 RECORDS FLAGGED FOR OMISSION (cont.)

Finally, note that records of XRF readings flagged for omission contain readings which were prematurely interrupted or were taken using procedures that were departures from the data collection protocols. Most of the readings were retaken whenever it was possible to do so in the field.

Below are lists that provide information for identifying records flagged for omission from the LAB_ICP, TEST_KIT, XRF_NORM, and XRF_CTRL data sets. A separate list is provided for each data set. In the lists are variables sufficient to uniquely identify a record when used in conjunction with the OMIT flag. Descriptions and definitions of identifying variables are given in preceding sections. The lists also provide reasons for the omission flag.

80488	08/16/93	XL prototype	M	1	9:20	Machine reset; retested.

12.0 ERRATA

This section contains corrections for errata identified in the report *A Field Test of Lead-Based Paint Testing Technologies: Technical Report*. The description of each omission or error is underlined; the correction is in bold face type following the description.

1. Beginning on page 6-341, the following passage is incorrect: "For example, there are 31 error rates exceeding 10%; of these, only two were reduced below 10% by use of the average, and both improvements were small (11.1% versus 10.2% false negative rates for the Lead Analyzer K-shell on concrete and 7.4% versus 6.8% false negative rates for the Microlead I on plaster)."

The correct wording for this passage is: "**For example, there are 36 error rates exceeding 10%; of these, only two were reduced below 10% by use of the average, and both improvements were small (11.1 % versus 7.4% false negative rates for the Lead Analyzer K-shell on concrete and 10.2% versus 6.8% false negative rates for the Microlead I on plaster).**"

2. In Section 4, the page numbering is incorrect for the series of pages numbered 4-35, 4-34, 4-35, and all the subsequent pages in section 4 after this series of pages.

The series of pages in the text numbered 4-35, 4-34, 4-35 should be numbered 4-35, 4-36, 4-37. All subsequent pages in section 4 should be incremented by 2 to be correctly numbered. Hence the current page 4-36 in the text becomes 4-38, page 4-37 becomes page 4-39, and so on for the remainder of section 4.

3. The notes at the bottom of Table 4-17 (beginning on the current page 4-54 in the text) include the equation $\text{RATIO2} = \text{AREA1} \div \text{AREA2}$. This equation is incorrect.

The correct equation is: **$\text{RATIO2} = \text{AREA2} \div \text{AREA1}$** . (The data in Table 4-17 were computed correctly, and no change is necessary other than correcting the equation in the text).

..

12.0 ERRATA (cont.)

4. The notes at the bottom of Table 4-18 (beginning on the current page 4-59 in the text) include the equation $\text{RATIO2} = \text{PERCENT1} \div \text{PERCENT2}$. This equation is incorrect.

The correct equation is: **$\text{RATIO2} = \text{PERCENT2} \div \text{PERCENT1}$** . (The data in Table 4-18 were computed correctly, and no change is necessary other than correcting the equation in the text).

5. A page of data is missing in Table 4-17. There should be another page of data between the current pages 4-54 and 4-55 in the text. **The following table of data should be inserted between the data on the current pages 4-54 and 4-55 in the text.**

SAMPLE ID	AREA1	AREA2	SUBSTRATE	CITY	LOG(AREA1)	LOG(AREA2)	RATIO1	RATIO2
